

Codecat15

Post an image to the server

Codecat15

Multiple ways of doing this

1. The Base64 way.
2. The Byte array way.
3. Multipart/form-data way.

Codecat15

Swagger documentation review

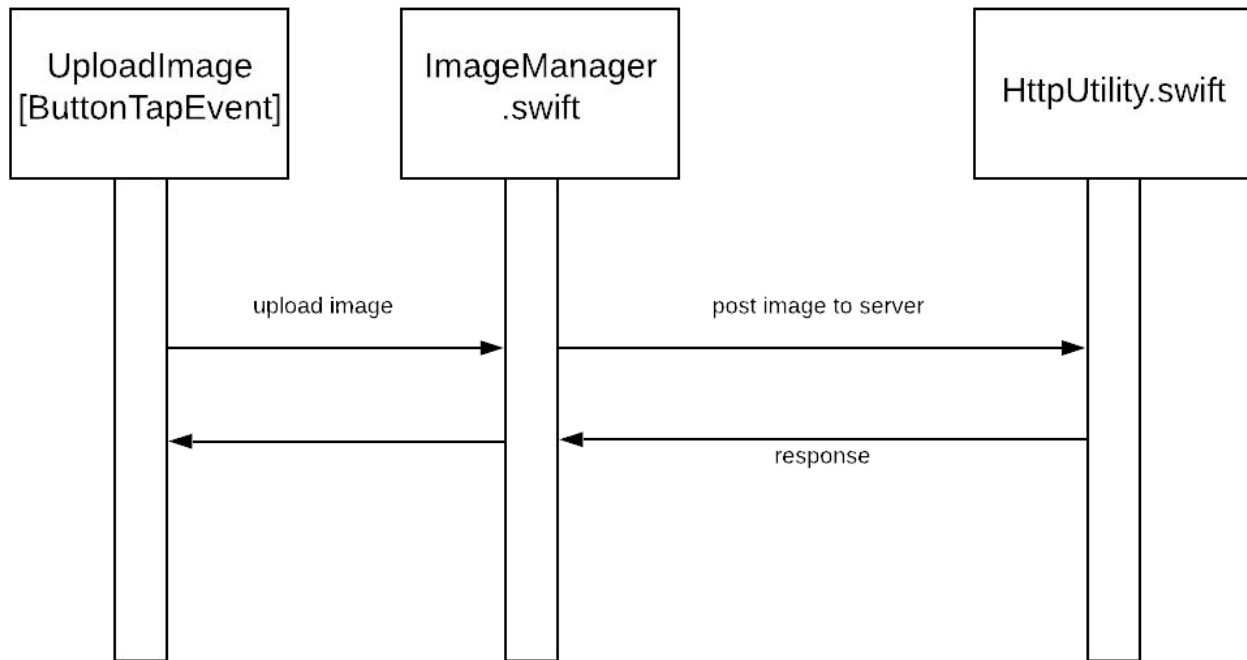

Codecat15

I assume you already know the concept of base64 and byte array.

Codecat15

Demo: Upload an image using base64 and byte array

Codecat15

Clean code tip

1. If you want to “GET” any media (image/videos) from the server.
2. Always ask the API developer to return a link to the image and not the actual image object.

Example: <https://www.your-domain.com/img/MyAwesomeImage.png>

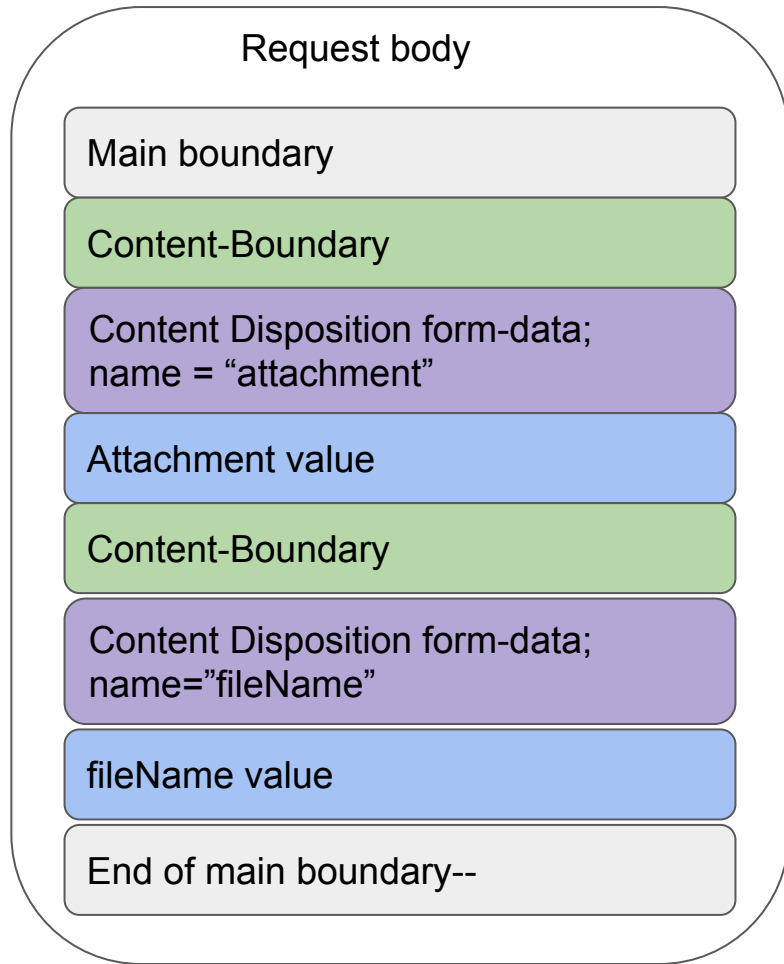

3. Media objects are huge and can consume bandwidth which impacts performance.

Multipart/form-data

1. Multipart/form-data is a content-type similar to application/json.
2. The post body contains multiple parts and each part is divided by a boundary.

```
Struct ImageRequest
{
  let attachment: String
  let fileName: String
}
```

Demo: Upload an image using multipart/form-data
